

Inventory and Product Category Management

1. Inventory Stock Thresholds

Reordering of products must be triggered when inventory levels drop below a minimum threshold of 15 units per product category to prevent stockouts.

2. Category Activation Rules

Only product categories marked as active are eligible for ordering and promotion. Categories inactive for more than 60 days must be reviewed for permanent discontinuation.

3. Product Lifecycle Management

Products with a sell end date earlier than 90 days from current date must be scheduled for clearance sale and removal from active listings.

4. Weight and Shipping Limitations

Products exceeding 50kg must be handled with specialized shipping methods and equipment to ensure safe delivery and compliance with logistics policies.

5. Category Review Schedule

Product categories must undergo performance and pricing reviews at least every 6 months to align with market demand and corporate strategy.

6. Cross-Category Promotions

Promotions involving multiple product categories require combined margin verification and joint management approvals.
